

ABSTRACT OF RESEARCH PAPER

As we have done a detailed review/seminar on the base topic CHNTPW. CHNTPW is a KALI LINUX tool used to reset local Windows password that we used to take access over the Windows system. CHNTPW is a simple tool that usually works by deleting the SAM file that is existing in the local system config folder. SAM file is the database file for storing the password hashes.

On advance research we would be comparing on CHNTPW with other password breaking tools in Kali Linux like Hydra, Ncrack tool and THC-pptp-bruter force.

The comparisons can be made based on the different ability of the tools to break or reset the password available.
